

Landscape CL

New Product Launch

In addition to our established products Landscape20 and Sports10, we are introducing LandscapeCL to the TOPSOIL range.

LandscapeCL is a specialised clay loam topsoil, developed specifically for non-demanding planting environments such as embankments, hedgerows and landscape schemes that require moisture-retentive soils.

LandscapeCL is ideal for embankments

Analysis

This new topsoil has been analysed to the newly revised British Standard for topsoil BS3882:2007 by Tim O'Hare Associates and a typical Analysis Sheet is available for prospective customers. It can be downloaded from the TOPSOIL website.

Application

It is important that the physical condition of the soil is maintained and as such, all soil handling operations should be carried out when the soil is dry and non-plastic (friable) in consistency.

Because of its textural classification, clay loam will inherently hold moisture and consequently may become stickier during wetter times of the year.

Storage

All TOPSOIL products are delivered in their optimum condition and therefore to maintain the product's consistency and ensure easy application it is advisable to keep it covered if it is not being used immediately. Due to its slow-draining nature, it may suffer from seasonal waterlogging.

Quality

Due to the stringent, fully-audited standards rigorously maintained throughout the TOPSOIL business, LandscapeCL has a dependable quality assured by regular independent analysis. Unlike 'muckaway', it is entirely free of contaminated waste, glass or building material residue and is devoid of invasive weeds such as Japanese Knotweed.

LandscapeCL will contain some stones up to 50mm in size.

It is disease-free and contains no pesticide contamination.

Weed Control

All British Sugar's TOPSOIL products are derived from prime arable soils and their natural fertility will encourage good plant growth but this does mean weeds need to be controlled. This is particularly important in the early stages of seeding to allow the sown grasses/species to thrive; if left unchecked the weeds will out-compete the grass or plants.

Within areas sown to grasses, the control of annual weeds is normally achieved by regular cutting/mowing. Control in planted areas is achieved by mulching; if a herbicide is used, please check the label for efficacy and application.
